

Rattlesnake Safety

Rattlesnake Facts:

- Only 1 venomous snake on base - the Southern Pacific Rattlesnake.
- Rattlesnakes avoid contact with people - give them space and they will likely retreat.
- Where can they be found?
Debris piles, wood piles, rock clusters, along the edges of buildings, trails, tall brush, laying out on concrete, pavement and roadsides.

Prevention Tips:

- Be aware of your surroundings when outdoors. Do not step or place hands in areas that you can not see, and use tools when moving rocks and debris
- Stick to well-used trails. Avoid walking and hiking in tall grass, weeds and heavy underbrush. Step on logs and rocks, never over them.
- Keep house exterior and yard clear of debris piles where snakes could hide.
- Wear sturdy boots and loose-fitting long pants during outdoor activities.

How to Identify a Rattlesnake -

There are key things to look for when trying to identify a rattlesnake from more commonly found non-venomous snakes.

1 EYE SHAPE

Rattlesnake eyes have vertical cat-like pupils instead of round pupils.

2 HEAD SHAPE

Rattlesnake have a wider, triangular shaped head in relation to their neck size.

3 BODY SIZE

Rattlesnakes tend to have a wider, thicker main body, while other snakes have a more even width throughout.

4 THE TAIL

Rattlesnakes have a segmented rattle at the end of a blocky tail which makes noise when vibrated instead of tails that gradually taper to a point. In rare cases a rattlesnake can be found without a rattle.

Rattlesnake Bites -

Bite victims should go to the nearest medical facility to be treated. If you receive hospital treatment within 3 hours of a bite, successful treatment is highly likely.

- DO - remain calm and avoid physical exertion
- DO - loosen any restrictive jewelry/clothing
- DO - get to the nearest doctor or hospital

- DO NOT - make incisions over the wound
- DO NOT - constrict the flow of blood
- DO NOT - try to extract the venom
- DO NOT - try to catch or kill the snake
