Below is included a brief detail of the tailoring process and three different tailoring examples (Tailored requirements, NEW requirements, and non-applicable requirements) that document the process of tailoring. All three examples are taken from AFSPCMAN 91-710 Volume 3, 2019.

Tailoring Brief

The AFSPCMAN 91-710 safety requirements provides for a contractual-like agreement between the US Space Force and the Range User on specific safety requirements that are established for the life of the program. The Tailoring process provides a means for formulating a specific edition of AFSPCMAN 91-710 (referred to here on out as this publication), incorporating only those requirements applicable to a particular Range User program. Additionally, the tailoring process documents "*whether or not*" the Range User will meet the requirements as written, or achieve an Equivalent Level of Safety (ELS) through an acceptable alternative. Requirements of this publication are subject to tailoring within limits.

The purpose of tailoring the publication is to ensure that only applicable requirements are identified and to determine whether or not the requirement will be met as written, or through an alternative means that will provide an ELS.

The FAA shall be included in the tailoring process for licensed or permitted programs at AFSPC ranges per the memorandum of agreement between HQ USSF and the FAA/AST on Resolving Requests for Relief from Common Launch Safety Requirements (Ref. Volume 1, section 4.4).

Although the tailoring may reference waivers, waivers shall be approved through a separate waiver process, as no requirement can be waived during the tailoring process. When a requirement is not met, the Range User can submit a noncompliance requests. Details and requirements for submitting noncompliance request(s) can be found in Volume 1, Attachment 4.

An approved tailoring proposal commonly results with the three following situations:

- 1. A requirement is determined to be not applicable to the systems and or operations.
- 2. A requirement is modified based on an ELS which meets the intent of the original requirement.
- 3. A new requirement is added based on new technologies, propellants, materials, and/or processes.

For the case of an ELS, the Range User is required to submit a detailed rational behind the intent of their proposed tailoring and should clarify how they maintain an ELS with meeting the intent of the requirement. This will require an associated hazard analysis determining the ELS. Upon receipt of a Range User tailoring proposal, Range Safety will evaluate the proposal for determining if an ELS is met by a potential system against all performance requirements. A change is allowed to tailor the requirement to a particular system/operation as long as the intent of the requirement is met and the ELS is maintained.

Similarly, an evaluation for non-applicable requirements will be verified and in the case of new requirements, Range Safety will evaluate the proposal on levels of safety against performance requirements.

Each AFSPCMAN 91-710 [T] shall contain a preface paragraph detailing the critical assumptions that were made in writing the tailored edition. The nature of the assumptions shall be such that a change in assumptions may invalidate the AFSPCMAN 91-710 [T] or require a change or update. The assumption(s) described in the Tailoring Request form shall include sufficient detail to categorize the scope of the tailored requirement to the specific systems or subsystems affected by the proposed change.

If two or more systems/subsystems are affected by the tailored paragraph, then the assumption(s) shall state which of those systems/subsystems is intended to be included in the scope of the tailoring. If there is a difference in the tailoring for the two or more systems/subsystems, then the tailored paragraph shall be repeated with appropriate tailoring unique to each individual system/subsystem. All changes shall be highlighted in bold. Deletions of text, including partial deletions, shall be shown with the original text marked with strikethrough. Insertions of text, including partial insertions, shall be shown with the new text marked with underline.

Technical Interchange Meetings (TIMs) are required for Range Users to present their systems to Range Safety and to participate in the active tailoring of the publication. TIMs shall be scheduled as early in the program as possible when program definition is sufficient. AFSPCMAN 91-710 [T] TIM data shall be provided to Range Safety at least 30 days before scheduled TIMs unless otherwise agreed to.

The forms for submitting Tailoring Requests are available from the Range Safety offices. (See examples below.) During the TIM process, through dialog and negotiation, Range Safety will comment on the proposed change and dispose of it as "approved as written," "approved with provided comments," or "disapproved."

Please reference Volume 1, Section 4.4 and Attachment 2 for further details on the AFSPCMAN 91-710 Tailoring Process.

Tailoring Examples

Guidance for Tailoring is given in AFSPCMAN 91-710 Volume 1, Attachment 2. The tailoring follows the volume requirement paragraph format with the following columns:

| Column | Title |
|--------|----------------------|
| 1 | Paragraph # |
| 2 | Original Language |
| 3 | Code |
| 4 | Tailored Language |
| 5 | Tailoring Rationale |
| 6 | Range Safety Comment |
| | |

Note: the Code is either (I) Information, (C) Comply, (T) Tailored, (N/A) Not Applicable, (NEW) New Requirement, or Non-Compliance [(MIC) Meets Intent Certification, (D) Deviation, (W) Waiver]

In the examples below the Range User provides their recommendations for tailoring and their rationale on equivalent level of safety for Tailored requirements. In the last column, Range Safety would provide comment on concurrence, or non-concurrence of the Tailoring.

Tailoring Example

Tailoring Example 3. Non-Applicable Requirement

| Name | Original Language | Code | Tailored Language | Tailoring Rationale | Range Safety Comments/Approval Status |
|--------|---|------|-------------------|---------------------|--|
| 18.1 | General. In addition to the | N/A | | Range User program | |
| | requirements in Chapter 6 and Chapter | | | does not use solid | |
| | 13 of this volume, the following data and | | | ROCKELS. | |
| | analysis shall be provided for solid | | | | |
| | segments: | | | | |
| 18.1.1 | Structural analyses for all aerospace | N/A | | Range User program | |
| | ground equipment used to handle rocket | | | does not use Solid | |
| | motors and segments. This includes | | | Rockets. | |
| | items such as handling rings, special | | | | |
| | breakover fixtures, air pallets, segment | | | | |
| | and motor stands, special lifting fixtures, | | | | |
| | and critical motor component | | | | |
| | installation fixtures. | | | | |
| 18.1.2 | Initial and periodic NDE plans for the | N/A | | Range User program | |
| | aerospace ground equipment, as | | | does not use Solid | |
| | required in 6.1.1.3.2.1. Single failure | | | Rockets. | |
| | items and SFP welds shall be clearly | | | | |
| | identified. | | | | |
| 18.2 | FMECA and OHA. FMECA and | N/A | | Range User program | |
| | operational hazard analysis (OHA) for all | | | does not use Solid | |
| | aspects of solid rocket segment and/or | | | Rockets. | |
| | motor handling and buildup. This | | | | |
| | analysis shall include the following: | | | | |
| 18.2.1 | An assessment of the probability of the | N/A | | Range User program | |
| | motor or segment igniting and possibly | | | does not use Solid | |
| | becoming propulsive upon mechanical, | | | Rockets. | |
| | electrical, or thermal shock. | | | | |

Rev 1

| Name | Original Language | Code | Tailored Language | Tailoring Rationale | Range Safety Comments/Approval |
|--------|---|------|-------------------|---------------------|--------------------------------|
| Hame | | couc | | | Status |
| 18.2.2 | An assessment of the requirements for | N/A | | Range User program | |
| | onsite NDE testing of rocket motor | | | does not use Solid | |
| | segment and/or motors. X-ray or | | | Rockets. | |
| | ultrasonic testing equipment failure | | | | |
| | modes, and their effect on the rocket | | | | |
| | motor/segment shall be analyzed. This | | | | |
| | analysis is particularly important for | | | | |
| | equipment used to inspect rocket motor | | | | |
| | bore. | | | | |
| 18.3 | Lightning Effects Hazard Analysis. For | N/A | | Range User program | |
| | solid rocket segment/motor processing | | | does not use Solid | |
| | and storage facilities, a lightning effects | | | Rockets. | |
| | hazard analysis that analyzes the effects | | | | |
| | of a lightning strike on the rocket motor | | | | |
| | segments and/or motors inside these | | | | |
| | facilities shall be performed. This | | | | |
| | analysis shall specify operational | | | | |
| | restrictions; in other words, no lifting or | | | | |
| | handling of segments or motors during | | | | |
| | lightning advisory periods. | | | | |
| 18.4 | Solid Rocket Motor and Motor Segment | N/A | | Range User program | |
| | Data Requirements. The data | | | does not use Solid | |
| | requirements found in Attachment 2, | | | Rockets. | |
| | A2.2.4.9.6 shall be submitted for solid | | | | |
| | rocket motors and motor segments. | | | | |
